

tomcat部署

1.把项目打war包 放入webapps 文件夹

2.修改conf下的servicex.xml文件

```
<!-- 复制host节点 修改name 属性自己设置域名导致-->
<Host name="manager.movie.com" appBase="webapps"
unpackWARs="true" autoDeploy="true">
<!--t添加context节点-->
<Context path="/" docBase='movie-manager' debug="0" reloadable="true"/>
<!-- SingleSignOn valve, share authentication between web applications
Documentation at: /docs/config/valve.html -->
<!--
<Valve className="org.apache.catalina.authenticator.SingleSignOn" />
-->
<!-- Access log processes all example.
Documentation at: /docs/config/valve.html
Note: The pattern used is equivalent to using pattern="common" -->
<Valve className="org.apache.catalina.valves.AccessLogValve" directory="logs"
prefix="localhost_access_log" suffix=".txt"
pattern="%h %l %u %t \"%r\" %s %b" />
</Host>
```

3.修改windows system32 文件下 hosts 文件 增加域名和ip的对应关系

```
192.168.1.19    manager.movie.com
192.168.1.19    user.movie.com
```

4.启动tomcat

1. window 系统 startup.bat
2. linux 系统 startup.sh
